

PRODUCT MANUAL

PURE ARCHTOP

Thank you for choosing the Pure Archtop for your guitar! This manual is quite long and detailed to help you install the Pure Archtop for best possible performance. Installing the system is quite easy so please take the time to read and follow this manual as precisely as possible.

Tools Needed

- Electric drill (for endpin jack mount)
- Drill bits 3/8" (10mm) to pre-drill and 1/2" (12mm) for final endpin jack mount.
- Pliers or wrench for endpin jack installation
- Superglue gel (for permanent installation)

This Pure Archtop Includes

- Two transducers with cable-harness and endpin jack
- Double side adhesive film (if superglue installation is not desired)
- 2 ft feeder wire

Preparation

Place the guitar on a table with a soft blanket for protection, with the guitar top facing up. The 2 pickups are supposed to be installed as shown in the picture (last page). Make sure that the wood surface on these spots inside your guitar is smooth and clear of any bumps.

You have 2 installation options:

- Removable with double-sided adhesive tape
- Permanent with superglue gel

Note: A permanent pickup installation with superglue gel will result in a 30-40% higher output volume and better frequency response due to the molecular bonding capacities of the superglue.

Drilling the Endpin Hole

You have to drill or widen the endpin hole to 1/2". If you feel insecure in doing this, please get help from

a luthier or from the guitar tech. These guys have the right tools to properly do the job.

If you'd rather do it yourself, it is a good idea to slowly work your way up with several drill bits, starting with a small size and work up in small increments.

Stick some duct tape over the endpin hole area. This helps to prevent chips and scratches. You should use at least a 3/8" (10mm) drill bit first and then widen the hole to the required 1/2" (12.5mm) drill bit.

Practice Installation (with Double-Sided Tape)

Cut a piece of the double-sided tape, a little larger than one pickup. Remove the white protection paper and stick the tape to the golden side of one transducer. Trim the tape around the edges of the pickup with a small pair of scissors.

Practice the installation of one pickup without removing the brown protective paper. Make sure you feel confident that you can reach the required position before you actually stick the pickup into your guitar.

Practice Installation (with Superglue Gel)

Practice installing one pickup without applying superglue. Make sure you feel confident that you can reach the required position before you actually glue the pickup into your guitar. Also make sure that you'll be able to press and hold the pickup there for about 30 seconds.

Installation

When you're ready, cover your guitar around the F holes with some paper or tape the surrounding area with masking tape. This protects your instrument in case you accidentally drop a little bit of the superglue on it. WEAR LATEX GLOVES when you

superglue! This will protect your fingers during installation.

Remove the strap-knob, the nut, and 2 washers off the endpin. Set the inner nut (this one is tight against the terminal cap) to the required distance according to the thickness of your end block. Finding the right position may require some trial and error. Tighten the terminal cap against the nut by screwing it in clockwise.

Stick the 2 ft feeder wire into the endpin hole and pull the other end out of one F hole. Make sure that you leave a few inches of wire hanging out of the endpin hole.

Tape Installation: Peel of the brown tape off one pickup and install it as practiced.

Superglue Installation: Apply a generous amount of superglue gel to one pickup. Spread the gel with the tip of the tube over the entire golden surface.

Important: If you use too little glue, it tends to partially dry before you are able to bring the pickup in its proper position! A generous amount of glue will prevent premature drying.

Install the pickup as practiced and hold it tight in position for about 30 seconds.

Tie the copper wire to the endpin jack at one of the small 1/8" holes on its end. Pull the endpin jack out of the endpin hole with the feeder wire. If the distance of the inner nut was not set right, you have to push the jack back through the F hole and do it again. Carefully remove the feeder wire without sliding the endpin jack back into the hole. Install the endpin jack's outer washers, nut, and strap knob.

Insert the feeder wire into the next F hole and pull it out of the other one. Carefully tighten the second pickup to the feeder wire and pull it out through the other F hole. Install the second pickup the same way as the first one.

REMOVING THE PICKUPS

You can remove the pickups if they were installed with the double-sided tape. Lift off an edge of the pickup with a fingernail or a suitable tool and break the bond. Once the pickups are pulled off, you can rub off the glue residue with your thumb or use a solvent like Naphtha to clean it (available in hardware stores).

If the pickups were super-glued, removal is not recommended. However, experienced luthiers should be able to remove the pickups by cutting them out with a special tool. Be aware that this will most likely damage the pickups. It also is dangerous to work with a cutting tool inside your guitar where you can't see what you are doing.

If you need to remove this pickup after installation, please **do not use any kind of chemical or solvent on the pickup!** This includes products like acetone, Goo-Gone, super glue remover, rubbing alcohol, WD-40, or similar.

Using any kind of solvent will de-laminate and destroy the pickup.

Please make sure you read and understand the disclaimer below before you proceed with a superglue installation or removal. Please call our help line if you have any questions: (541) 888-3517

Disclaimer regarding the installation or removal of the Pure Pickup:

Installation or removal is at your own risk. In no event will K&K Sound Systems Inc. be liable to you for any damages arising from your use of, or, the inability to use this product. This includes any possible health hazards, injuries, any lost profits, or other incidental or consequential damages, even if K&K Sound Systems Inc. has been advised of the possibility of such damages, or for any claim by another party. Exact following of mounting instructions and handling instructions for supplied superglue is mandatory.

SUPERGLUE NOT INCLUDED!

Please purchase any brand of **SUPERGLUE GEL** (Cyanoacrylate) before beginning installation.

IMPORTANT! Please ensure that you are buying **superglue gel** (the package will specify) as this is essential for proper installation.

Preparing superglue for use:

- Knead superglue before using to ensure even consistency.
- Test the superglue by gluing a penny to a piece of wood. Apply pressure for about 30 seconds.
- The glue on the penny should cure after another 30 seconds, meaning that the gel has hardened and the penny is firmly attached. If the glue did not cure properly, please discard it and repeat steps with a fresh tube.

Using superglue properly creates a molecular bond between the pickup and the instrument and is the single most important factor in the final performance of the pickup! Please do not skip these steps.
